i Three species of 'Ermine' (Yponomeuta) are very similar and cannot be reliably distinguished by eye – Y. padella (Orchard Ermine), Y. malinellus (Apple Ermine) and Y. Cagnagella (Spindle Ermine). However, in this case, some of the visitors present at unpacking the traps reported seeing the webs in the apple trees close to the trapping site. It is therefore highly likely that the specimens netted during the night and found in the trap are Apple Ermine.

ii Cnephasia spp. – the grey Tortrix Cnephasia cannot be reliably visually determined with any certainty and mostly share the same foodplants. Gen. Det. is needed to determine specimens at species level.

iii Grey Dagger and Dark Dagger are visually identical and need dissection and examination of the genitalia to distinguish them at species level.

iv When counting 'Uncertain' and the next on the list, 'Rustic' I have aggregated all specimens found. Some can definitely be identified as 'Uncertain' and other definitely as 'Rustic'. However, due to the numbers being processed while unpacking and the time available to consider individual specimens it seemed safer to 'aggregate' these two species which can be very similar, especially with worn examples.

v Marbled Minor, Tawny Marbled Minor and Rufous Minor are very similar and require gen. det. To determine at species level for certainty.
